Abstract: This article is about the educational process of future specialists the process of working with the terminology of the railway sector is considered. Railway the classification of terms related to the field and the procedure for its application are explained. English railway terminology is distinguished by its content and structural features, linguistic point of view. It is part of the lexicon of the language. Methodology of teaching a foreign language is a component of linguodidactics, and when teaching terms, their linguistic the importance of features is discussed.

Key words: terminology feature, lexical unit, methodology, didactics, lexical, component, technology, Foreign Language, English.

Introduction. In the current conditions of international freight traffic, this type of transport seems to be the most reliable and efficient, especially for cargo transportation between the European Union, Russia and China.

It should be noted that the strengthening of quarantine measures during customs clearance will lead to delays in cargo transportation. Thus, the delivery time of goods increases. At the same time, it is more important than ever to ensure efficient document circulation in the registration of routes and deliveries. In this case, knowledge of a foreign

language is the main factor in solving the specified problem. During the period under review, the value of specialists who know a foreign language in the labor market has increased. At the current stage, it is impossible to organize passenger transportation without providing communication in a foreign language. It is simply necessary to explain to foreign nationals the sanitary standards for traveling by air, sea and rail. This is especially true when organizing the work of transport hubs and ports.

Infographics, using English as the official language and international communication language, are important for the participants of the cargo and passenger transportation process to be able to convey information to the public clearly and quickly through graphic images, concise but informative notes. This measure helps to ensure sanitary-epidemiological standards in the organization of passenger services, to correctly form passenger flows that exclude critical gathering of people in a limited area, to maintain the necessary distance during a pandemic and to ensure the use of personal protective equipment. Infographics have become especially relevant today as a necessary universal communication tool in crowded places such as centers and ports. All of the above speaks of the importance of knowing a foreign language.

During his studies at the university, a modern specialist successfully practices not only grammar and regional studies, but also a large amount of special vocabulary in professionally oriented texts. Practice shows that supporting documents for international logistics relations is possible only using foreign languages and, in most cases, English. It can be said with confidence that the practical language component is of great importance in the training of transport specialists, which enables competent management of the international document circulation, which is the legal basis of the transport business.

Thus, the subject "Foreign language (academic and professional interaction)" in higher educational institutions of railway transport is one of the bases that ensures the professional growth of employees who ensure the development of the transport network. According to the educational and methodological manuals developed within the

framework of the Federal State Education Standard, students study such professionally oriented topics as "Business ethics", "Modern trends in the development of the railway sector", "Modern railway infrastructure". Train maintenance", "Railways", "Locomotives" and locomotive facilities", "Railway safety and high speed. transport" and others.

In general, these projects are aimed at realizing the export potential of our country. It should be noted that it is impossible to provide transport and logistics communication processes without the use of the English language, without a professional dictionary that is convenient for cooperation.

Also, online technologies have shown in practice that teaching a foreign language is related to the continuous development of work skills of teachers and students within the framework of information and communication technologies. In addition, in exchange for knowledge of a professional foreign language and the format of distance education, wide opportunities are opening up for the organization of professional development in international educational institutions.

Methodology. Today, the reforms carried out in the country's industrial systems are accelerating the flow of international terms entering the lexical level of the language. This situation dictates that the owners of the sphere have sufficient knowledge of the original essence and meaning of the terms and concepts related to their profession.

Conclusion. In conclusion, thanks to such international platforms, business relations and effective relations are created between economic partner countries. Provides the development of a strategy for the development of the transport business in the future, one of the means of its implementation is knowledge of a professionally oriented foreign language. In this regard, the issue of the introduction of new technologies in the process of developing the methodological support of practical training in a foreign language, as well as revising the methodology of teaching a foreign language within the higher educational

institution of railway transport, arose. This represents an area of further research and development at this stage.
